

Laravel Test

In this task you are going to implement a tiny content management system using Laravel framework for backend.

•

The frontend of the project looks like below:

Landing Page:

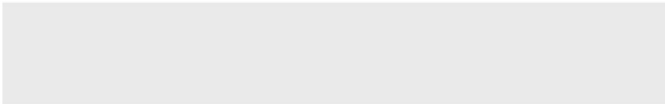

Frontend:

1. There should be two sections shown side by side.
 - a. Section 1
 - b. Section 2
2. Every item of these sections may either be a video or a post. If it is a video please show a video icon at the right and bottom corner as appearing in the mock up.
3. The Posts and Videos should appear on the correct layout.
4. You may use bootstrap for building the layout.
5. We will see how you reuse blade layout to achieve the layout.
6. When clicked on an item it should take user to the correct detail page. (If it is a post, it should take user to a post detail, if it is video then it should take user to video URL)
7. You are given the freedom to style the layout as you want. We like simple styling.

Detail Page:

There are two types of detail page.

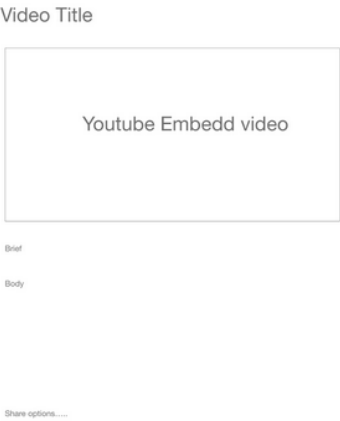

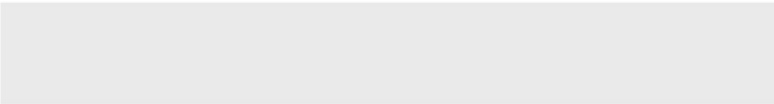

Detail page for Post: should contain Title, the image and below image the body.

Detail page for Video:

Detail page for video should contain :

Video Title, The youtube video link, body and share options.

Admin Panel:

1. As an admin I would like to login and create a post or video using a form.
2. I would like to specifically mention the type of the content (Video/ Post)
3. I would like to specifically mention where this post will appear (In section 1 or in section 2)
4. If I unpublish content from the admin panel it should not show in the frontend.
5. I would like to see forms are validated from backend
 - a. Validation criteria:
 - i. Duplicate title for post and video is not allowed.
 - ii. All the fields are required.
6. Edit content is not needed.
7. I would like to log out from the admin panel.
